(57) The present invention relates to a method or process concerning the transportation of an alarmed container (1), particularly with regard to the transportation of valuable objects or valuable documents. The container (1) includes a first electronic unit (2) which functions to accept and permit

deactivation and/or opening of the container, wherein the container is opened with the aid of a primary key (10) which includes a second electronic unit (12) that communicates with the first electronic unit (2) in respect of initiating opening of the container. The primary key (10) accompanies a person transporting the container (1) and the container is opened and/or its alarm system deactivated at its destination, with the aid of a code subset (AB) from the person-carried primary key (10) in co-action with a code subset (CD) obtained from a destination-located secondary key (20), therewith providing a total code-set (ABCD) required for initiating opening/deactivation of the container. When a transportation route (100) includes a number of delivery destinations/collection destinations (110, 120, 130), the secondary keys (20) having mutually varying code subsets are placed at said destinations, wherewith the aforesaid person-carried primary key (10) enables the container to be opened/deactivated in co-action with code subsets (CD, EF, GH) obtained from respective secondary keys (20) at respective destinations (110, 120, 130) over a chosen transportation route (100), for instance.
